

Study Guide for Geometric Shapes/Transformations

1. Polygons can be regular or irregular

Polygons	<ul style="list-style-type: none">- Two-dimensional- Closed shape- Straight sides
Regular Polygons	<ul style="list-style-type: none">- All sides are the same length- All angles are the same
Irregular Polygons	<ul style="list-style-type: none">- Not all sides are the same length and/or- Not all angles are the same

2. Shapes can be classified by their number of sides and vertices

of sides = # of vertices

Vertices are where two sides meet. The vertices of a shape are the corners.

Name of Shape	Number of Sides
Hexagon	6
Pentagon	5
Triangle	3
Quadrilateral	4
Octagon	8

3. Angles can be named in shapes

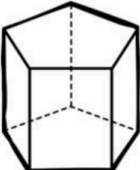

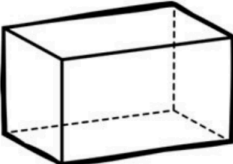

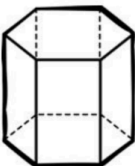

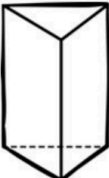

4. Triangles can be labeled as acute, right, or obtuse

Acute Triangle	Right Triangle	Obtuse Triangle
All Angles Are Less Than 90°	1 Angle Is 90°	1 Angle Is Greater Than 90°

5. Triangles can be labelled as equilateral, isosceles, or scalene

Equilateral Triangle	Isosceles Triangle	Scalene Triangle
3 Equal Sides 3 Equal Angles	2 Equal Sides 2 Equal Angles	No Equal Sides No Equal Angles

6. Prisms can be classified by their number of faces, edges, and vertices.

7. Lines can be parallel, intersecting, or perpendicular

8. There are several types of quadrilaterals

9. Determining complimentary angles

Complimentary Angles are two angles that add up to 90° . Therefore, the angles 40° and 50° are complimentary angles because they add up to 90° . Together, complimentary angles add up to make a right angle.

Example:

We can determine the missing complimentary angle by subtracting the known angle from 90.

10. Determining supplementary angles

Supplementary Angles are two angles that add up to 180° . You will notice that two supplementary angles make a straight angle of 180° .

Example:

We can determine the missing supplementary angle by subtracting the known angle from 180.

11. There are 3 types of transformations:

- a. slide - Translate
- b. Flip - Reflect
- c. Turn - Rotate

12. Describing translations using words.

Shape A is the original object

First Left/Right, **Then** Up/Down

1) 2 left, 4 down

2) _____

3) _____

4) _____

5) _____

6) _____

13. Performing translations

1) Left 4, down 3

3) Left 6, up 2

5) Left 3, down 6

2) Right 5, down 4

4) Right 5, up 5

6) Left 2, up 4

14. Reflecting shapes across the line of symmetry

Questions

Reflect the shapes across the mirror line

15. Describing rotations using clockwise or counterclockwise.

Rotations can either be clockwise or counterclockwise.

A **clockwise** rotation moves the same way the minute, second, and hour hands move on a clock.

A **counterclockwise** rotation moves the opposite way of a clockwise turn.

We can rotate things a lot or a little. Check out the three turns below.

Questions

Describe the rotations. Shape A is the original shape

1) _____

2) _____

3) _____

4) _____

5) _____

6) _____

7) _____

8) _____

16. Rotating shapes around a marked point.

Your child may use a piece of parchment paper to support them with describing rotations if they would like

1) 180° rotation

3) 90° clock-wise rotation

5) 180° rotation

2) 90° counter-clockwise rotation

4) 90° clock-wise rotation

6) 90° counter-clockwise rotation
